Version 1 Progress Report B

Since submitting my Version 1 Progress Report A, I have continued to refine and expand the functionality of my project. One of the primary additions has been the development of a dedicated rubrics page, which will host sample assessment rubrics for grading websites, podcasts, digital stories, video essays, and infographics. I used Claude AI to assist with generating and organizing some of this content. In addition, I redesigned the overall Streamlit application to create a more polished, professional, and visually engaging user experience for the visitor to my site and in preparation for the project's launch.

What Has Been Implemented?

Most of the work completed since Progress Report A has focused on improving the site's visual presentation, its access, and its overall user experience. Specifically, I have:

- Refined the website's color palette to create a more cohesive and professional design.
- Developed additional video assets (which will be hosted externally but embedded on the site) to support the instructional content on the site.
- Researched hosting options for video assets and explored ways to integrate those assets effectively with the project.
- Deployed the site from GitHub so that I, the developer, can test out its functionality to gain an understanding of what the user would experience on Streamlit

New Files and Assets

I have created and organized new folders and files within my GitHub repository. At this stage, I am exploring how to convert existing Word documents into CSV files where appropriate and determining the most effective way to host video assets. I am currently evaluating whether hosting videos on YouTube will best support the content and resources housed within my GitHub repository. I have created a very simple login page and sign-up for prospective users of my site, who will be either students or instructors.

Next Steps

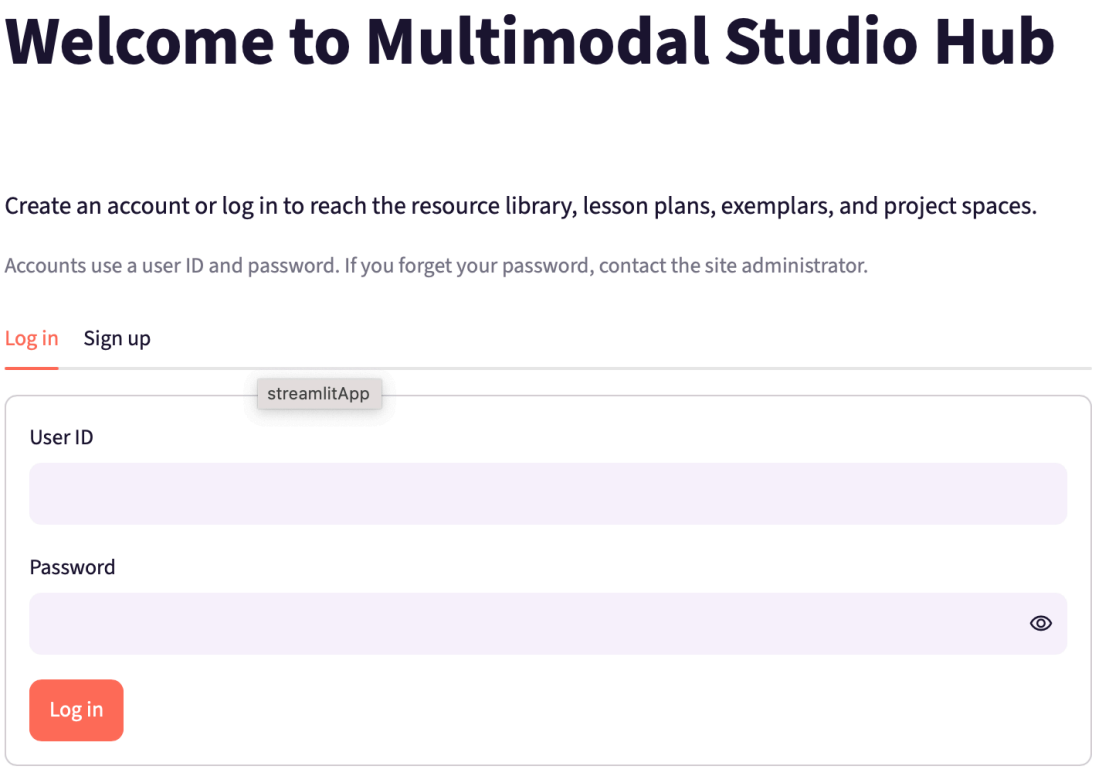

My next steps involve completing light edits to my video assets and preparing them for publication on a newly created YouTube channel, which will serve as the primary host for instructional videos and supporting media. Once all assets are finalized and uploaded, I will focus on integrating them into the host website, which is a YouTube channel.

One challenge I have encountered is my limited experience with GitHub Desktop and repository management. I have it downloaded, but I do not know how to use it, and I am

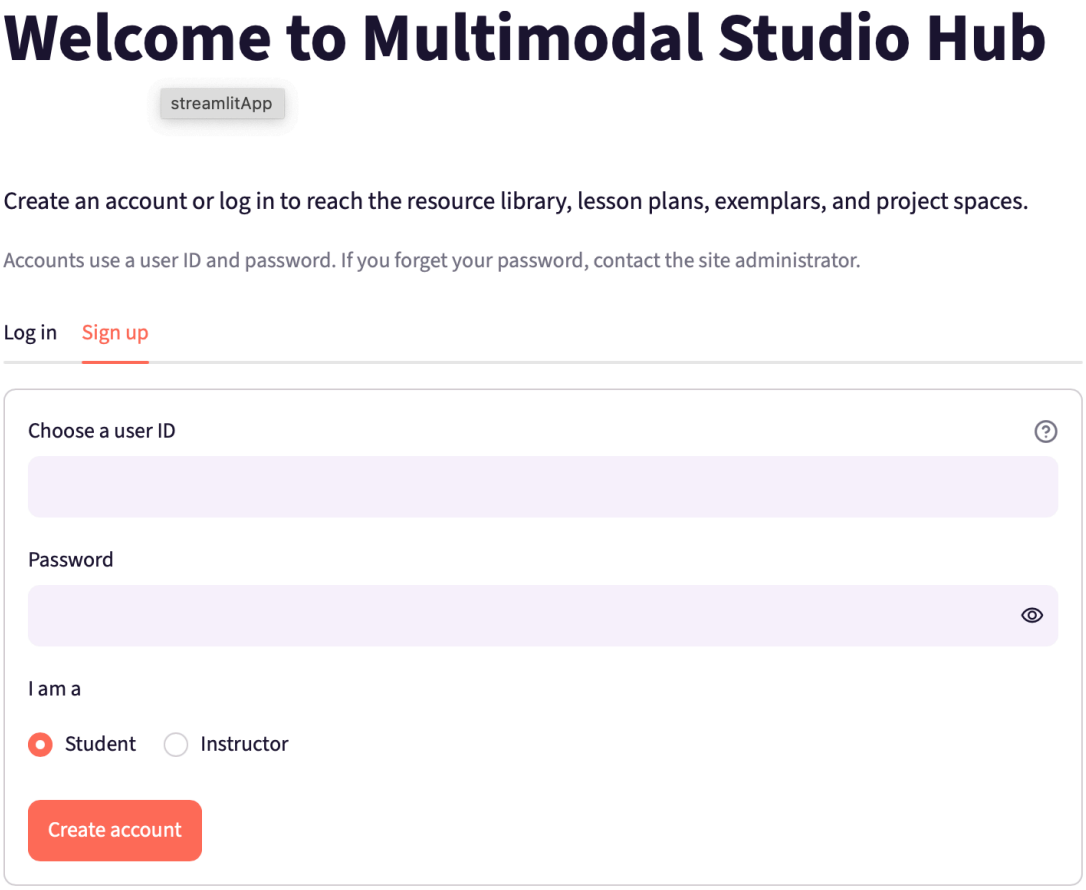

currently questioning its purpose. As a result, there is a learning curve associated with organizing files and folders effectively and understanding GitHub workflows. To address this, I plan to carefully review the course lecture videos, pausing and revisiting sections as necessary to ensure that I understand and can replicate each step demonstrated. If I encounter difficulties or am unable to successfully implement the procedures covered in the videos, I will seek additional guidance and support from you.

Overall, I am making steady progress and believe that once the remaining assets are finalized and properly organized, I will be well-positioned to launch a polished and functional version of the site before this course is over.
